No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antigens (II) from Streptococcus pneumoniae. The protein antigens have bactericidal activity. The nucleic acids, encoding the protein antigens, may be used for the recombinant production of the proteins they encode. The protein antigens may then be used as vaccines for the prevention and treatment of Streptococcal infections in mammals (especially humans) which result in, e.g. meningitis, citis media, bacteraemia and/or pneumonia. The present sequence represents a S. pneumoniae BVH-11 protein

antigens (II) from Streptococcus pneumoniae. The protein antigens have bactericidal activity. The nucleic acids, encoding the protein antigens, may be used for the recombinant production of the proteins they encode. The protein antigens may then be used as vaccines for the prevention and treatment of Streptococcal infections in mammals (especially humans) which result in, e.g. meningitis, others madia, bacteraemia and/or pneumonia. The present sequence represents a S. pneumoniae BVH-11-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        90

antigens (II) from Streptococcus pneumoniae. The protein antigens have bactericidal activity. The nucleic acids, encoding the protein antigens, may be used for the recombinant production of the proteins they encode. The protein antigens may then be used as vaccines for the prevention and treatment of Streptococcal infections in mammals (especially humans) which result in, e.g. meningitis, otitis media, bacteraemia and/or pneumonia. The present sequence represents a S. pneumoniae BVH-11 protein antigen, from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antigens (II) from Streptococcus pneumoniae.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                             antigens (II) from Streptococcus pneumoniae. The protein antigens have bactericidal activity. The nucleic acids, encoding the protein antigens, may be used for the recombinant production of the proteins they encode. The protein antigens may then be used as vaccines for the prevention and treatment of Streptococcal infections in mammals (especially humans) which result in, e.g. meningitis, otitis media, bacteraemia and/or pneumonia. The present sequence represents a S. pneumoniae BVH-11 protein antigen, from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    90

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antigens (II) from Streptococcus pneumoniae. The protein antigens have bactericidal activity. The nucleic acids, encoding the protein antigens, may be used for the recombinant production of the proteins they encode. The protein antigens may then be used as vaccines for the prevention and treatment of Streptococcal infections in mammals (especially humans) which result in, e.g. meningitis, otitis media, bacteraemia and/or pneumonia. The present sequence represents a S. pneumoniae BVH-11 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                   11 TVKENNRVSYIDGKQATQKTENLTPDEVSKREGINAEQIVIKITDQGYVTSHGDHYHYYN 70

antigens (II) from Streptococcus pneumoniae. The protein antigens have bactericidal activity. The nucleic acids, encoding the protein antigens, may be used for the recombinant production of the proteins they encode. The protein antigens may then be used as vaccines for the prevention and treatment of Streptococcal infections in mammals (especially humans) which result in, e.g. meningils, otitis media, bacteraemia and/or pneumonia. The present sequence represents a S. pneumoniae BVH-11 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                31 ENLTPDEVSKREGINAEQIVIKITDQGYVTSHCDHYHYYNGKVPYDAIISEELLMKDPNY

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      BVH-3; BVH-11; vaccine; meningitis; otitis media; bacteraemia; pneumonia; streptococcal bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes an isolated polypeptide (I) with 70-90% identity to Streptococcus pneumonia protein BVH-3, BVH-11, variants of BVH-3 or BVH-11, or chimeric sequences derived from them. A vaccine (II) comprising (I) is useful for therapeutic or prophylactic treatment of meningitis, otitis media, bacteraemia or pneumonia infection in an individual susceptible to these disorders. (II) is also useful for therapeutic or prophylactic treatment of any streptococcal bacterial infection (e.g., caused by Streptococcus pneumoniae, group B Streptococcus such as Streptococcus prophylactic or group as Streptococcus such as Streptococcus prophylactic or Group Streptococcus such as Streptococcus agalactiae, S. dysgalactiae, S. uberis, S. nocardia or
                                                                                                                                                                                                                                                                                                     70
           The present invention describes nucleic acids (I) encoding protein antigens (II) from Streptococcus pneumoniae. The protein antigens have bactericidal activity. The nucleic acids, encoding the protein antigens, may be used for the recombinant production of the proteins they encode. The protein antigens may then be used as vaccines for the prevention and treatment of Streptococcal infections in mammals (especially humans) which result in, e.g. meningitis, otitis media, bacteraemia and/or pneumonia. The present sequence represents the S. pneumoniae BVH-11

The invention relates to a novel isolated polypeptide of Streptococcus pneumoniae. A polypeptide of the invention has antibacterial, antinflammatory, and auditory activity, and is used as a vaccine. The polypeptide or pharmaceutical composition is useful for the prophylactic or therapeutic treatment of streptococcal infection, meningitis, othiss media, bacteraemia or pneumonia infection. The kit is useful for detecting or diagnosing streptococcal infection. The pharmaceutical composition is useful as a vaccine. The polynucleotides are useful in designing DNA probes for detecting circulating Streptococcus in a biological sample. The present sequence is used in the exemplification of the invention. Note: The sequence data for this patent is not fully
                                                                                                                                                                                                                                                                                                     0
          polymucleocide (III) encoding (I) is useful in DNA immunisation techniques. The Streptococcus polypeptides are useful in a diagnostic test for S. pneumoniae infection. (III) is useful for designing DNA probes for use in detecting the presence of Streptococcus in a biological sample suspected of containing the bacteria. The DNA probes may also be used for detecting circulating S. pneumonia nucleic acid in a sample for diagnosing streptococcul infections. This is the amino acid sequence of Streptococcus pneumoniae protein BVH-II, used to create the antigenic peptides described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                31 TVKENNRVSYIDGKQATQKTENLTPDEVSKREGINAEQIVIKITDQGYVTSHGDHYHYYN 90
Staphylococcus aureus) in an individual susceptible to the infection. A

The invention describes an isolated polypeptide (I) with 70-90% identity to Streptococcus pneumonia protein BVH-3, BVH-11, variants of BVH-3 or BVH-11, or chimeric Sequences derived from them. A vaccine (II) comprising (I) is useful for therapeutic or prophylactic treatment of melingitis, otitis media, bacteraemia or pneumonia infection in an individual susceptible to these disorders. (II) is also useful for therapeutic or prophylactic treatment of any streptococcus lacterial infection (e.g., caused by Streptococcus pneumoniae, group A Streptococcus such as Streptococcus group B Streptococcus such as Streptococcus group B Streptococcus ancreus) in an individual susceptible to the infection. A polypulocetic (III) encoding (I) is useful in DNA immunisation techniques. The Streptococcus polypupetides are useful in a diagnostic test for S pneumoniae infection. (III) is useful for designing DNA creat for S pneumoniae infection. (III) is useful for designing DNA sample suspected of containing the presence of Streptococcus in a biological sample suspected of containing the bacteria. The DNA probes may also be used for detecting circulating S pneumonia nucleic acid in a sample for diagnosing streptococcus insertions. This sequence repersents a truncate of a streptococcus insertions. This sequence represents a truncate of a streptococcus insertions. This sequence represents a truncate of a streptococcus insertions. This sequence repersents a truncate of a streptococcus insertions. This sequence is a prepared to the subsection of a streptococcus insertions. The sequence repersents a truncate of the streptococcus insertions. This is sequence is the sequence of 
    useful as vaccine components for treating or preventing infections such as otitis media, meningitis, and

                                                                                                                                                                                                      The invention relates to a novel isolated polypeptide of Streptococcus pneumoniae. A polypeptide of the invention has antibacterial, antiinflammatory, and auditory activity, and is used as a vaccine. The polypeptide or pharmaceutical composition is useful for the prophylactic or therapeutic treatment of streptococcal infection, meningitis, otitis media, bacteraemia or pneumonia infection. The kit is useful for detecting or diagnosing streptococcal infection. The pharmaceutical composition is useful as a vaccine. The polynuclectides are useful in designing DNA probes for detecting circulating Streptococcus in a biological sample. The present sequence is used in the exemplification of the invention. Note: The sequence data for this patent is not fully represented in the printed specification, but is based on sequence information supplied by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         71

New Streptococcus pneumoniae BVH-3 and BVH-11 variant and epitope-bearing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        BVH-3; BVH-11; vaccine; meningitis; otitis media; bacteraemia; pneumonia; streptococcal bacterial infection; mutant; mutein.
                                                                                                                                                                                                                                                                                          The present invention describes nucleic acids (I) encoding protein antigens (II) from Streptococcus pneumoniae. The protein antigens have bactericidal activity. The nucleic acids, encoding the protein antigens, may be used for the recombinant production of the proteins they encode. The protein antigens may then be used as vaccines for the prevention and treatment of Streptococcal infections in mammals (especially humans) which result in, e.g. meningitis, otitis media, bacteraemia and/or pneumonia. The present sequence represents the S. pneumoniae BVH-11M
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  71

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antigens (II) from Streptococcus pneumoniae. The protein antigens have bactericidal activity. The nucleic acids, encoding the protein antigens, may be used for the recombinant production of the proteins they encode. The protein antigens may then be used as vaccines for the prevention and treatment of Streptococcal infections in mammals (especially humans) which result in, e.g. meningitis, ottiss media, bacteraemia and/or pneumonia. The present sequence represents a S. pneumoniae BWH-11 protein antigen, from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          70

The invention describes an isolated polypeptide (I) with 70-90% identity to Streptococcus pneumonia protein BVH-3, BVH-11, variants of BVH-3 or BVH-11, or chimeric sequences derived from them. A vaccine (II) comparising (I) is useful for therapeutic or prophylactic treatment of maintail susceptible to these disorders. (II) is also useful for individual susceptible to these disorders. (II) is also useful for therapeutic or prophylactic treatment of any streptococcal bacterial infection (e.g., caused by Streptococcus proup A streptococcus such as Streptococcus such as Streptococcus prophylactic treatment of any streptococcus such as Streptococcus aureus) in an individual susceptible to the infection. A streptococcus aureus) in an individual susceptible to the infection. A colymuleotide (III) encoding (I) is useful in DNA immunisation techniques. The Streptococcus polypeptides are useful in a diagnostic test for S. pneumoniae infection. (III) is useful for designing DNA creptococcus infections of III) is useful in a sample for sample suspected of containing the bacteria. The DNA probes may also be used for detecting circulating S. pneumonia nucleic acid in a sample for described in the method of the invention. Note: This sequence does not appear in the specification but has been created according to information arithe according to information.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New Streptococcus pneumoniae BVH-3 and BVH-11 variant and epitope-bearing polypeptides, useful as vaccine components for treating or preventing streptococcal infections such as otitis media, meningitis, and

The present sequence is used in the exemplification of the invention. Note: The sequence data for this parent is not fully represented in the printed specification, but is based on sequence information supplied by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel isolated polypeptide of Streptococcus pneumoniae. A polypeptide of the invention has antibacterial, antiintlammatory, and auditory activity, and is used as a vaccine. The polypeptide or pharmaceutical composition is useful for the prophylactic or therapeutic treatment of streptococcal infection, meningitis, otitis media, bacteraemia or pneumonia infection. The kit is useful for detecting or diagnosing streptococcal infection. The pharmaceutical composition is useful as a vaccine. The polymucleotides are useful in designing DNA probes for detecting circulating streptococcus in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         11 TVKENNRVSYIDGKQATQKTENLTPDEVSKREGINAEQIVIKITDQGYVTSHGDHYHYYN 70

A polypeptide of the invention has antibacterial, antiinflammatory, and auditory activity, and is used as a vaccine. The polypeptide or pharmaceutical composition is useful for the prophylactic or therapeutic treatment of streptococcal infection, meningitis, otitis media, bacteraemia or pneumonia infection. The kit is useful for detecting or diagnosing streptococcal infection. The pharmaceutical composition is useful as a vaccine. The polymucleotides are useful in designing DNA probes for detecting circulating Streptococcus in a biological sample. The present sequence is used in the exemplification of the invention. Note: The sequence data for this patent is not fully represented in the printed specification, but is based on sequence information supplied by the European Patent Office
described in the method of the invention. Note: This sequence does not appear in the specification but has been created according to information given in the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes nucleic acids (I) encoding protein antigens antigens (II) from Streptococcus pneumoniae. The protein antigens have bactericidal activity. The nucleic acids, encoding the protein antigens, may be used for the recombinant production of the proteins they encode. The protein antigens may then be used as vaccines for the prevention and treatment of Streptococcal infections in mammals (especially humans) which result in, e.g. meningitis, otitis media, bacteraemia and/or pneumonia. The present sequence represents the S. pneumoniae NEW16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TVKENNRVSYIDGKQATQKTENLTPDEVSKREGINAEQIVIKITDQGYVTSHGDHYHYYN 70

The invention describes an isolated polypeptide (1) with 70-90% identity to Streptococcus pneumonia protein BVH-3, BVH-11, variants of BVH-3 or the BVH-11, or chimeric sequences derived from them. A vaccine (II) or chimeric sequences derived from them. A vaccine (III) or chimeric sequences derived from them. A vaccine (III) comprising (I) is useful for therapeutic or prophylactic treatment of prophylactic treatment of any streptococcal bacterial or therapeutic or prophylactic treatment of any streptococcal bacterial infection (e.g., caused by Streptococcus promoniae, group A streptococcus such as Streptococcus pyogenes, group B Streptococcus such as Streptococcus pyogenes, group B Streptococcus avacus) in an individual susceptible to the infection. A polymucleotide (III) encoding (I) is useful in DNA immunisation termiques. The Streptococcus pypeptides are useful in a diagnostic test for S. pneumoniae infection. (III) is useful for designing DNA probes may also be constaining the bacteria. The DNA probes may also be used for detecting circulating S. pneumonia nucleic acid in a sample for diagnosing streptococcal infections. This sequence represents a truncate of a Streptococcus in a biological cused for detecting enemonia nucleic acid in a sample for diagnosing streptococcal infections. This sequence represents a truncate of a Streptococcus pneumoniae gene used to obtain antigenic peptides,
                                                                                                                                                                                                               BVH-3; BVH-11; vaccine; meningitis; otitis media; bacteraemia; pneumonia; streptococcal bacterial infection; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New Streptococcus pneumoniae BVH-3 and BVH-11 variant and epitope-bearing polypeptides, useful as vaccine components for treating or preventing streptococcal infections such as otitis media, meningitis, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            B

                      AAU84027
```

The present invention describes nucleic acids (1) encoding protein antigens (11) from Streptococcus pneumoniae. The protein antigens have bactericidal activity. The nucleic acids, encoding the protein antigens, may be used for the recombinant production of the proteins they encode. The protein antigens may then be used as vaccines for the prevention and treatment of Streptococcal infections in mammals (especially humans) which result in, e.g. meningitis, otitis media, bacteraemia and/or pneumonia. The present sequence represents the S. pneumoniae BVH-11A

Although a number of proteins have been suggested as being involved in the pathogenicity of Streptococcus pneumoniae, there still remains a need to identify polypeptides having epitopes in common from various strains of S. pneumoniae in order to utilise such polypeptides in vaccines to protect against a wide variety of S. pneumoniae. New vaccine compositions are described which comprise a Streptococcus pneumoniae polypeptide (or fragments) of 80 - 680 amino acids in length that comprise at least one histidine triad residue (HxxHH) or a colled-coil region, or an antibody directed against these features. The vaccine is useful in protecting against infection by Streptococcus pneumoniae. The vaccine composition comprising antibodies to is useful for passive immunization for treating pneumococcal infections which includes otitis media, nasopharyngeal and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AHADNVRIKEEINRQKQEHSQHREGGIPRNDGAVALARSQGRYITDDGYIFNASDIIEDT 180

246

The invention relates to a protein comprising or having at least 50% identify to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified bNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleotides 8-100 of a sequence not defined in the specification, for amplifying a target contained within a Streptococcus nucleic acid sequence to the first primer is substantially complementary to the target sequence and the second primer is substantially complementary to the complement of the target sequence, and where the parts of the primers having substantial complementarity define the termin of the target sequence to be amplified, assay comprising contacting a test compound with the protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes concoling the proteins has been rendered inactive. The proteins, and disease or infection due to streptococcus card molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus. Concounting a disease or infection due to streptococcus card antibiotics. The present sequence is one of the 2469 proteins expressed by the identified odding regions from the genomic sequence. Note: The sequence data for this patent did not form the genomic sequence. Note: The sequence data for this patent did not form the genomic sequence. Note: The sequence of the sequence of the fight primer of the sequence of the fight. 120 180 186 09 99 New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media o 7 SYELGLYQARTVKENNRVSYIDGKQATQKTENLTPDEVSKREGINAEQIVIKITDQGYVT SHGDHYHYYNGKVPYDAIISEELLMKDPNYKLKDEDIVNEVKGGYVIKVDGKYYVYLKDA 127 AHADNVRTKEEINRQKQEHSQHREGGTPRNDGAVALARSQGRYTTDDGYIFNASDIIEDT GDAYIVPHGDHYHYIPKNELSASELAAAEAFLSGRGNLSNSRTYRRQNSDNTSRTNWVPS GDAYIVPHGDHYHYIPKNELSASELAAAEAFLSGRGNLSNSRTYRRQNSDNTSRTNWVPS 1 SYELGLYQARTVKENNRVSYIDGKQATQKTENLTPDEVSKREGINAEQIVIKITDQGYVT 121 AHADNVRTKEEINRQKQEHSQHREGGTPRNDGAVALARSQGRYTTDDGYIFNASDIIEDT . ij 9 DB Mismatches Score 695; I Pred. The invention relates to an isolated polymucleotide consisting of a Streptococcus pneumoniae nucleic acid (appearing as ADC45122 and encoding $8028) one of 113 disclosed nucleic acids encoding 113 s. pneumoniae antigens. Also included are making a recombinant vector by inserting the nucleic acid into a vector, an isolated polymucleotide consisting of at recombinant host call comprising the $8028 nucleic acid, and a recombinant host call comprising the $8028 polymucleotide. The nucleic acids are useful as DNA vaccine against Streptococcus pneumoniae infection (e.g. pneumonia). Nucleic acids derived from the S. pneumoniae antigen nucleic acids are useful as probes for use in diagnostic methods for detecting S. pneumoniae appearance in the present sequence represents an S. pneumoniae antigenic protein.
                                                                                         Novel polynucleotide encoding Streptococcus pneumoniae polypeptides useful for producing vaccines for prevention or attenuation of infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fannon MR;

                                                                                                                                                à
                                                                                                                                                                                                                                      ABQ84792 to ABQ84904 represents nucleic acids which encode the prevences pneumoniae antigens given in ABP4557 to ABP54669. The S. pneumoniae antigens have autibacterial activity and can be used in vaccines. The S. pneumoniae antigens can also be used to prevent or attenuate a Streptococcal infection in an animal. The polymucleotides encoding the S. pneumoniae antigens can be used to detect Streptococcus nucleic acids. ABQ84905 to ABQ8130 represent primers used in the cloning of S. pneumoniae ORFS (open reading frames) which are used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             540
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   600
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   600

The present sequence represents a protein from Streptococcus pneumoniae. The nucleic acid sequence encoding the Streptococcus pneumoniae protein can be useful in vaccines for inducing protective antibodies against streptococcus pneumonia, for treatment or prevention of infection e.g. pneumonia, otitis media or meningitis. Probes based on the nucleic acid are used to detect Streptococcus infection (by usual hybridisation or amplification methods), also for isolating Streptococcus genes or their allelic variants. The protein can be used similarly to detect specific noritodies in standard immunoassays, especially for diagnosing or monitoring infections. Antibodies which bind the protein are used to detect corresponding antighens, to purify the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, e.g. by injection, orally or through the skin, typically at 0.01-1000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 SHGDHYHYYNGKVPYDAIISEELLMKDPNYKLKDEDIVNEVKGGYVIKVDGKYYVYLKDA 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  y Sequence 2, Application US/09468656A

Sequence 2, Application US/09468656A

Patent No. 6582706

GENERAL INFORMATION:

APPLICANT: Johnson, Leslie S.

TITLE OF INVENTION: Vaccine Compositions Comprising Streptococcus

TITLE OF INVENTION: Motifs

TITLE OF INVENTION: Motifs

TITLE OF INVENTION: Motifs

FILE REFERENCE: 468201-444

CURRENT APPLICATION NUMBER: 60/113,048

PRIOR APPLICATION NUMBER: 60/113,048

PRIOR PILING DATE: 1998-12-21

NUMBER OF SEQ ID NOS: 14

SOSTWARRE: Patentin Ver. 2.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
